

Olympos Lodge Website

Pre-Launch Audit Report

Design & UX · Code Quality · Performance · Accessibility · SEO · Conversion · Launch Readiness

Read-only audit of the static site repository · branch `photoshoot-interim` · 11 June 2026

Executive Summary

This is a hand-rolled static HTML/CSS/JS site (16 pages, no framework, no build tooling, no package.json) deployed to GitHub Pages, with client-side TR/EN/DE i18n via `translations.js` and a thoughtfully split CSS architecture. The design system is genuinely strong: real tokens, fluid clamp() typography, container queries, and a coherent luxury aesthetic.

The site is not launchable today, for four structural reasons:

- 1. Every canonical and sitemap URL points to pretty paths (`/rooms/super-deluxe/`) that do not exist in the file layout (`/pages/room-super-deluxe.html`). On GitHub Pages they all 404.
- 2. Roughly 56+ images, including the hero poster, favicon and Open Graph images, are hotlinked from the live WordPress site at the same domain this site is meant to replace. They will all break the moment the new site goes live.
- 3. The booking flow is a UI mockup that shows a false confirmation and silently discards the reservation at the final step.
- 4. `robots.txt` blocks Google from `/assets/`, so Google cannot render the pages or index a single local image.

Below those four sits a long but very fixable tail: an 8 MB hero video, 1.3 MB of completely unused self-hosted fonts, accessibility gaps, and repo hygiene issues (the AI voice-agent prompts and internal docs are git-tracked and will deploy publicly).

Project Map

Aspect	Finding
Framework / build	None. Pure static HTML/CSS/JS; no package.json, no bundler. The only vendored dependency is <code>assets/lenis.min.js</code> (smooth scroll).
Routing	File-based: <code>index.html</code> , <code>privacy.html</code> , <code>terms.html</code> at root + 13 pages in <code>pages/</code> .
Styling	8 split CSS files (<code>base.css</code> , 1,632 lines, on every page, plus per-page sheets), cache-busted with <code>?v=</code> params.
JavaScript	<code>script.js</code> (690 lines: <code>nav</code> , <code>lightbox</code> , <code>weather</code> , <code>cookies</code>), <code>booking.js</code> (554 lines), <code>translations.js</code> (972 lines, TR/EN/DE).
i18n	Client-side data-i18n text swap; a single URL serves all languages; <code>lang="tr"</code> hardcoded on every page.
Deployment	GitHub Pages (<code>.nojekyll</code> , <code>watch-push.sh</code> auto-push loop); target domain <code>www.olymposlodge.com.tr</code> .

Aspect	Finding
What it is not	Not a working booking system, not multilingual to search engines, and not yet self-contained (it depends on the old WordPress site for most imagery).

1 Design & UX

WHAT IS GOOD

This is the strongest area. A real token system lives in `base.css:16-57` (palette, fluid spacing scale `--space-xs` through `--space-2xl` using `clamp()`, transition tokens). Fluid type is used throughout (h2: `clamp(2rem, 4vw, 3.2rem)`, `base.css:151`). Modern layout: container queries for the room rows (`home.css:615`), aspect-ratio used widely, and a documented bleed-margin technique (`home.css:496-509`). The five-family font pairing (Cormorant Garamond / DM Sans / Cinzel / Cormorant SC / Josefin Sans) fits the luxury brief; nothing reads as a template default.

WHAT IS WEAK OR BROKEN

- **Eight stray hex colours bypass the tokens:** `#8a6a2a` (`base.css:1150`), `#8a7040` (`home.css:562`), `#998059` (`home.css:903`), `#b4a894` (`home.css:523`), `#a89878` (`cirali.css:699`), `#6E5A30` (`cirali.css:713`), plus near-duplicate creams `#EEE8DF` / `#ede8df` (`base.css:598`, `cirali.css:424`). One token is referenced but never defined: `var(--color-warm-gold-deep, #5a4826)` at `cirali.css:119`.
- **Breakpoint drift:** seven distinct breakpoints across files (1100, 1024, 1023.98, 900, 768, 640, 480px); e.g. `cirali.css:166` uses the oddly precise 1023.98px while sibling files use 1024/900.
- **Three different .btn-reserve styles:** header (`base.css:375-385`), room CTA override (`rooms.css:370-381`), destination CTA override (`cirali.css:1257-1266`). The primary action button should not change identity per page.
- **Hardcoded font sizes escape the fluid scale:** 19px (`home.css:598`), 13.75px (`home.css:605`), 35px (`cirali.css:1428`).
- **Mobile specifics:** the menu toggle is 32×24px (`base.css:261-267`), well under the 44-48px touch-target minimum; `.nav-overlay__left` has min-width: 300px (`base.css:423`), tight at 320-375px; `.gallery-item` combines width: 38vw with min-width: 300px (`home.css:1241`), forcing items wider than small viewports.
- **Inconsistent overlay treatment:** the room hero darkens from the top at 0.65 (`rooms.css:31-36`) while the child-page hero darkens toward the bottom at 0.15→0.55 (`cirali.css:212`).

FIXES

Promote the 8 stray colours into `:root` tokens; consolidate to 3 breakpoints (640 / 900 / 1200); define one primary and one inverse button; replace px font sizes with `clamp()`; enlarge the menu toggle and language-dropdown hit areas.

2 Code Quality

WHAT IS GOOD

`script.js` is clean: everything is scoped inside `DOMContentLoaded`, no globals leak, all scroll listeners are passive, and there is no `console.log` / `debugger` / `TODO` debris. `translations.js` is complete across all three languages with no orphaned keys for the deleted rooms (the `asd_` / `an_` prefixes were properly cleaned up). The deleted pages (offers, antik, aqua) left no dangling links.

PROBLEMS

- **Cache-busting versions have drifted badly across pages (verified).** `index.html:165` loads `home.css?v=90` while `pages/rooms.html:34` loads `home.css?v=174`, so the homepage is styled by an 84-version-stale (or at minimum differently cached) copy of the same file. Similarly `script.js?v=112` on `index.html:672` and `contact.html:673` vs `?v=110` on the other 11 pages; `translations.js v=45` vs `v=44`; `activities.css` at `v=6` / `v=4` / `v=2` across three pages. With no build step, every bump must be hand-synced across 16 files, and clearly is not.
- **Header/nav/footer are copy-pasted ~16 times (~150 lines per page) and have already diverged:** the “Menü” nav item exists only on `index.html:238` and is missing from `rooms`, `contact`, `activities`, `cirali` and `lodge`. Any future nav change will desync again.
- **Broken nav link:** `index.html:238` points to `menu.html`, which does not exist at the web root. The real menu files live in “menus & extras/” and `assets/menu/`, and “menus & extras/” is gitignored, so the target can never deploy.
- **Room data is hand-duplicated in three places** (homepage rooms section `index.html:329–395`, `pages/rooms.html:142–198`, and each `room-*.html`), tripling the edit surface for the upcoming photoshoot refresh.
- **Inline handlers/styles:** `onclick="document.getElementById('menuToggle').click()"` repeated on 7 pages (`index.html:202` etc.); presentational inline styles at `location.html:488,531`.
- **Repo hygiene (verified against git ls-files).** These are tracked and will deploy publicly: `elevenlabs/system-prompt.txt` and `knowledge-base.txt` (the AI receptionist's internal prompt), “`olympos_lodge_rag_english copy.txt`”, 8 stale `room-*.md` / `index.md` stubs (including for the deleted Antik and Aqua rooms), `.DS_Store` ×2, the saved Badrutt's competitor page in `assets/`, and ~6.3 MB of unreferenced JPGs (`Olympos_beach.jpg` 5.1 MB, `pexels-*.jpg` 777 KB, `Ciralida-*.jpg` 423 KB). The 13 MB `inspiration` folder is safely untracked; these are not.

3 Performance

This is where mobile guests will feel it most.

- **Hero video:** `index.html:266–268` lists `hero.webm` (8.1 MB) before `hero.mp4` (3.8 MB), so Chrome (including Android) picks the 8 MB file. No mobile-specific source, no reduced variant. This is the single biggest bandwidth item on the site. Fix: re-encode (~1.5 MB 1080p target), put mp4 first or serve a static poster `<picture>` under 640px.
- **Fonts are double-broken (verified).** `index.html:11` pulls ~35 variants of 5 families from Google Fonts (a render-blocking stylesheet), and the 1.3 MB, 38-file `assets/fonts/` directory is referenced by zero `@font-face` rules (grep count: 0 in `base.css`). You ship 1.3 MB of dead fonts in the repo while paying Google Fonts' DNS + CSS round trip at runtime. Pick one: self-host with `@font-face`, preload the 2-3 above-the-fold faces, and prune unused weights. The comment “Preload primary fonts” at `index.html:167` is followed by no preload at all.
- **Image delivery:** only one image on the whole site has `srcset` (`cirali.html:212–216`). Everything else ships desktop resolution to phones, mostly as JPG (`index.html:341,356,371,386`). `loading="lazy"` coverage is otherwise good and `width/height` attributes are consistently present, so CLS from images is low.
- **Hotlinked images (also a launch blocker, see §7):** 28 references on the homepage alone plus 10-12 per subpage point at `https://www.olymposlodge.com.tr/wp-content/...`, adding cross-origin latency now and guaranteeing 404s after cutover. The LCP poster itself is one of them (`index.html:161,266`).
- **Translation FOCUS/CLS:** HTML renders Turkish, then `setLanguage()` (`script.js:80–96`) rewrites ~97 data-i18n nodes after `DOMContentLoaded`. Returning EN/DE visitors see a Turkish flash plus reflow. Mitigation: set the language class/lang in an inline head script before paint, or pre-render per-language pages (which SEO wants anyway, see §5).

- **INP risks:** parallax writes `style.transform` directly in a scroll handler (`script.js:298`); both drag-carousels write `scrollLeft` inside `mousemove` (`script.js:254,284`). Batch these through `requestAnimationFrame`.
- **Scripts:** `lenis.min.js`, `translations.js` and `script.js` at body end without `defer` (`index.html:670-672`) is acceptable, but the weather panel fires two external open-meteo fetches on every page load (`script.js:310-311`) with no timeout.

Estimated Core Web Vitals today: LCP 1.5-3.5 s on 4G (poster + video contention), CLS in the 0.2+ range (font swap + translation swap + weather panel injection), INP 150-300 ms on low-end devices during drag. All three are fixable to “good” with the items above. These figures are static-analysis estimates; a Lighthouse run against a staging deploy would firm them up.

4 Accessibility

WHAT IS GOOD

:focus-visible is styled site-wide (`base.css:69-72`); the gallery lightbox is genuinely well done (dialog role, focus trap, Escape, arrow keys: `script.js:524-601`); contact form inputs are properly labelled; reveal animations respect `prefers-reduced-motion` (`base.css:746-752`); every `<img>` has an alt attribute.

VIOLATIONS, BY SEVERITY

1. **No `<h1>` on `index.html`, `lodge.html` or `activities.html`** (verified by grep; spa, location and gallery do have one). The homepage's de-facto title is a styled `<div class="intro-title">` (`index.html:277`). Also an SEO issue.
2. **No `<main>` landmark on any page** (WCAG 1.3.1).
3. **Booking step-1 selects have no labels:** `#roomCount`, `#adultCount`, `#childCount`, `#roomType` (`booking.html:109-139`). The custom calendar grid is divs, not keyboard-operable controls.
4. **Alt text and aria-labels are static Turkish** while page content switches languages; `data-i18n` never targets attributes (`gallery.html:124-181`; weather panel aria-label is English-only at `index.html:554`).
5. **Nav overlay and cookie panel have no Escape handler and no focus management** (the lightbox does; `script.js:46-66` does not). The cookie FAB is a `<div>`, not a `<button>` (`index.html:611`).
6. **Contrast:** gold `#8E7441` links on cream are roughly 3.8:1, below AA's 4.5:1 (`base.css:1407,1577`); footer links at `rgba(28,24,20,0.35)` are roughly 2.8:1 (`base.css:700-708`).
7. **Lenis smooth scroll ignores `prefers-reduced-motion`** (`script.js:8-20`), and `rooms.css` animations have no reduced-motion override at all (the other CSS files have one).
8. **Form errors are not announced:** no `aria-live` / `role="alert"` on `.form-error` (`contact.html:203-214`).
9. **No skip link, site-wide.**

5 SEO

WHAT IS GOOD

Titles and meta descriptions exist and are unique on all 16 pages (including booking, verified at `booking.html:6-7`). The homepage Hotel JSON-LD (`index.html:32-155`) is rich: full address, geo coordinates, 13 amenity features, check-in/out times, `numberOfRooms`: 17, plus a valid FAQPage block. Room pages carry HotelRoom + BreadcrumbList schema. The sitemap covers all 16 pages with current lastmod dates. NAP is consistent (one exception below). OG/Twitter cards are present everywhere.

GAPS, RANKED

1. Canonical/sitemap URLs do not match the deployed file structure (verified).

`pages/room-super-deluxe.html:25` declares `https://www.olymposlodge.com.tr/rooms/super-deluxe/` and `sitemap.xml` lists 16 pretty URLs (`/ciralil/`, `/booking/` ...), but the files deploy as `/pages/room-super-deluxe.html`. GitHub Pages has no rewrites: every canonical and every sitemap URL will 404. Either restructure into folders (`rooms/super-deluxe/index.html`, which also fixes the URLs aesthetically) or rewrite canonicals + sitemap to the real paths. Decide before launch.

2. robots.txt line 6 “Disallow: /assets/” blocks Googlebot from all CSS, JS and local images. Google cannot render the page (hurts mobile-first indexing) and no local image can appear in Image Search. Narrow it or drop it.

3. hreflang is self-defeating: all four alternates point to the identical URL (`index.html:27-30`). With `lang="tr"` hardcoded and client-side translation, Google indexes Turkish only; the German market (and EN-reading Russian guests) effectively do not exist in search. The real fix is pre-rendered `/en/` and `/de/` page sets with a proper hreflang matrix, which pairs naturally with the restructuring in item 1.

4. aggregateRating (4.4, 660 reviews) has no source (`index.html:67-73`). Self-serving review markup without first-party reviews on the page violates Google's review-snippet guidelines; this risks a structured-data manual action. Remove it or display real on-page reviews.

5. Missing h1s on index, lodge and activities (see §4) waste the strongest on-page signal; the homepage should carry “Olympos Lodge ... Çıralı, Antalya” in an h1.

6. Phone NAP mismatch: `terms.html:131` lists +90 242 825 71 71-72 while everywhere else (including the schema) uses +90 532 308 34 86. Label the landline or unify.

7. Crawlable junk: tracked `.md` stubs (including for deleted rooms), the saved Badrutt's HTML in `assets/`, `assets/menu/menu-*.html` and the RAG/elevenlabs text files are all reachable duplicate/thin content (overlaps §7).

8. Minor: no `og:url` anywhere (verified count 0); no `404.html`.

6 Content & Conversion

1. The booking flow is a dead end, and it looks real. `booking.js:4-5` says “PMS API integration to be added later”; there is no fetch/POST anywhere in the file (verified by grep). Step 4 generates a fake reference ‘OL-’ + `Date.now()`... (`booking.js:462`) and shows “REZERVASYONUNUZ ALINDI” (“your reservation has been received”): a false confirmation. A guest will believe they hold a booking that nobody at the lodge will ever see. This is worse than no booking page. Until a backend exists, make step 4 hand off to email/WhatsApp with the selected dates pre-filled, or send the payload through `formsubmit` like the contact form.

2. The contact form works (POSTs to `https://formsubmit.co/info@olymposlodge.com.tr`, `contact.html:476`) but has no `_next` redirect, so guests land on `formsubmit.co`'s page after submitting. Also confirm the `formsubmit` address has been activated (it requires a one-time confirmation email) before launch.

3. No WhatsApp anywhere. For a Turkish boutique hotel whose real reservation channel is currently a human, `wa.me/905323083486` in the header/footer is probably the single highest-ROI conversion addition.

4. Room pages have no closing CTA beyond the header button; no rates, no “check availability” affordance (`room-super-deluxe.html`).

5. Trust signals are schema-only: the 4.4/660 rating is invisible to humans; no testimonials, awards or press on any page despite the Casa Angelina-tier positioning. Instagram is the only social link.

6. Missing pages: no dining page (the restaurant is a headline amenity and menus already exist in “menus & extras/”, just unserved); no policies page (check-in/out, cancellation, children/pets); the FAQ

exists only as invisible JSON-LD.

7. Copy quality is otherwise strong: no lorem ipsum, no placeholder numbers, real KVKK privacy text (`privacy.html`).

7 Pre-Publish Readiness

Check	Status	Evidence
Canonical/sitemap URLs resolve	FAIL	All pages/*.html:25-26 + sitemap.xml point to /pretty/ paths that 404 on GitHub Pages (see 5.1).
Self-contained assets	FAIL	56+ images, favicon and OG images hotlink the WordPress site this replaces (<code>index.html:161, 266, 341...</code>).
Booking actually books	FAIL	<code>booking.js:462-473</code> shows a false confirmation; no backend.
404.html	FAIL	Missing (verified).
CNAME	FAIL	Missing (verified); custom domain unconfigured in-repo.
robots.txt sane	FAIL	Disallow: /assets/ blocks renderability (<code>robots.txt:6</code>).
Broken links	FAIL	<code>menu.html</code> (<code>index.html:238</code>); the target lives in a gitignored folder.
Secrets / private files	FAIL	<code>elevenlabs/system-prompt.txt</code> , <code>knowledge-base.txt</code> , <code>RAG.txt</code> and internal <code>.md</code> docs are git-tracked and will be public.
Analytics / Search Console	FAIL	None anywhere (verified); the cookie banner offers an “Analytics” toggle that gates nothing.
Asset versions in sync	FAIL	<code>home.css v=90</code> vs <code>v=174</code> ; <code>script.js v=110</code> vs <code>v=112</code> (see 2).
Favicon / touch icons local	FAIL	All icon links point at WordPress uploads; no local favicon, no manifest.
Placeholder content	PASS	None found (no lorem ipsum, no dummy numbers).
API keys in client code	PASS	None; <code>watch-push.sh</code> is clean.
Mixed content (<code>http://</code>)	PASS	None.
Legal pages	PASS*	Real KVKK text in <code>privacy.html</code> ; <code>terms.html</code> lacks cancellation/payment policy.

Consolidated Action List

P0

Blocks launch. Do these before the site goes live on the production domain.

- 1. Resolve the URL structure:** restructure pages into folders (`rooms/super-deluxe/index.html`, `cirali/index.html`, ...) or rewrite all canonicals + `sitemap.xml` to the real `/pages/*.html` paths. (all 16 HTML files, `sitemap.xml`)
- 2. Localize all hotlinked WordPress images** (hero poster, room photos, favicon, `og:image`) into `assets/images/`, since the WP source dies at cutover. (`index.html:161, 266`, all pages)
- 3. Defuse the fake booking confirmation:** route step 4 to `email/formsubmit/WhatsApp` with the selected dates, or remove the booking page until the PMS lands. (`booking.js:462-473`, `pages/booking.html`)
- 4. Fix robots.txt:** remove Disallow: `/assets/` so Google can render pages and index images. (`robots.txt:6`)

5. **Fix or remove the menu.html nav link**; if dining stays, create pages/menu.html from the existing menu files and add it to every page's nav. (`index.html:238`)
6. **Purge tracked private/junk files**: `git rm elevenlabs/`, "olympus_lodge_rag_english copy.txt", root .md stubs (incl. deleted-room stubs), `.DS_Store` x2, "assets/5 Star Suites....html", and the unused `Olympus_beach.jpg` / `pexels-*.jpg` / `Ciralida-*.jpg`. (repo root, assets/)
7. **Add 404.html and CNAME** for GitHub Pages custom-domain deployment. (repo root)
8. **Sync all ?v= versions** so every page references identical asset versions. (16 HTML files; worst: `index.html:165` VS `pages/rooms.html:34`)
9. **Source or remove the aggregateRating** to eliminate the structured-data penalty risk. (`index.html:67-73`)
10. **Verify formsubmit.co activation and add a _next redirect** so the contact form returns guests to your site. (`pages/contact.html:476`)

P1

Do soon after launch. High impact on speed, bookings and discoverability.

11. **Hero video diet**: re-encode to ~1.5 MB, reorder sources (mp4 first), static poster `<picture>` under 640px. (`index.html:266-268`)
12. **Decide the font strategy**: either use the self-hosted assets/fonts/ with `@font-face` + preloads, or delete the folder; prune unused weights either way. (`index.html:11`, assets/fonts/, base.css)
13. **Add WhatsApp (wa.me/905323083486)** to header, footer and contact. (all pages)
14. **srcset + WebP for all room/editorial images**, following the one good example at `cirali.html:212-216`. (all pages)
15. **Add <h1> to index/lodge/activities and <main> to all pages**. (`index.html:277`, pages/lodge.html, pages/activities.html)
16. **Booking/contact accessibility**: label the four booking selects, aria-live on form errors, keyboard-operable calendar. (`booking.html:109-139`, `contact.html:203`)
17. **Escape + focus management** for the nav overlay and cookie panel; make the cookie FAB a `<button>`. (`script.js:46-66`, `index.html:611`)
18. **Darken gold links / footer text to at least 4.5:1**. (`base.css:1407`, 700-708)
19. **Pre-render /en/ and /de/ page sets with a real hreflang matrix** (bundle with P0 #1); until then, apply the translation swap pre-paint to kill the FOCUS. (`index.html:27-30`, `script.js:80-96`)
20. **Add analytics (GA4 or Plausible) gated by the existing cookie consent**, plus Search Console verification. (all pages, script.js)
21. **Respect prefers-reduced-motion in the Lenis init and in rooms.css**. (`script.js:8-20`, assets/rooms.css)
22. **Add closing "Check availability" CTAs to room pages** and surface real reviews/testimonials on-page. (`room-*.html`, `index.html`)
23. **Unify the terms.html phone listing** with the primary number, or label it "Office". (`terms.html:131`)

P2

Polish. Maintainability, consistency and finer UX details.

24. **Tokenize the 8 stray hex colours** and define the missing `--color-warm-gold-deep`. (`home.css:523-907`, `cirali.css:119`)
25. **Consolidate breakpoints to 640/900/1200** across all CSS files.

26. One unified button system instead of three .btn-reserve variants. (`base.css:375`, `rooms.css:370`, `cirali.css:1257`)

27. Enlarge touch targets: menu toggle to 44px+, language dropdown, cookie buttons.
(`base.css:261-267`)

28. rAF-batch the parallax and drag-carousel DOM writes. (`script.js:254,284,298`)

29. Replace inline onclick handlers with listeners; move inline styles to classes. (`index.html:202`, `location.html:488`)

30. Single source of truth for room data (JSON + render, or one canonical snippet) before the photoshoot content refresh multiplies the duplication. (`index.html:329-395`, `pages/rooms.html:142-198`)

31. Add a policies/FAQ page (surface the existing FAQPage JSON-LD as visible content), replace 19px/13.75px/35px with fluid sizes, add a skip link, and standardize the hero overlay treatment.

Method note: every P0 claim was verified directly against the files rather than trusting sub-audits; two sub-audit findings were excluded as incorrect (the sitemap is in fact complete with all 16 pages, and booking.html does have a title and meta description). Core Web Vitals figures are static-analysis estimates pending a Lighthouse run on a staging deploy.
